CSC 421 - APPLIED OPERATIONS RESEARCH

CREDIT HOURS: 3
PREREQUISITES: CSC 241; MTH 144 or 233; MTH 220
GRADE REMINDER: Must have a grade of C or better in each prerequisite course.

CATALOG DESCRIPTION

Quantitative techniques for resource management, decision making and system analysis with emphasis on development and use of computer implementations of mathematical models.

PURPOSE OF COURSE

To provide the student with an understanding of quantitative approaches to problem solving using methods of operations research. Deterministic models, including linear, integer, network, and nonlinear programming, and stochastic methods, including decision analysis, Markov models, and queuing systems, are applied to problems in constrained resource management, system analysis, and system optimization.

EDUCATIONAL OBJECTIVES

Upon successful completion of the course, students should be able to:

1. Create mathematical models for analyzing or optimizing a variety of resource management problems.
2. Develop mathematical programming models for certain systems having deterministic parameters.
3. Develop models for systems that exhibit stochastic behavior.
4. Identify algorithms for optimizing deterministic models, and methods for quantitatively describing the behavior and characteristics of probabilistic systems.
5. Demonstrate familiarity with commercial software that is available to support the quantitative decision techniques and analysis methods studied.
6. Select existing software or develop new software for specific applications.

Network Analysis

- Maximum flow
- Shortest path
- Transportation models
- Assignment and matching problems
- Critical path analysis
- Dynamic programming
- Implementation of algorithms and use of computer programs

Integer Programming

- Problem complexity
- Branch and bound methods
- Scheduling models
- Implementation of algorithms and applications

Markov Analysis

- Transition probabilities
- First passage times and first passage probabilities
- Steady state analysis
- Software for solution of systems of steady state equations

Queuing Models

- Arrival and departure distributions
- Computation of performance characteristics of queuing systems

Decisions Analysis

- Decision trees
- Game Theory

Exams (plus final)
