CSC 541 - COMPILER PRINCIPLES AND TECHNIQUES

CREDIT HOURS: 3
PREREQUISITES: CSC 342, 441
GRADE REMINDER: Must have a grade of C or better in each prerequisite course.

CATALOG DESCRIPTION

Language theory, grammars and recognizers, methods for lexical analysis, top-down and bottom-up parsing, code generation, run-time structures, optimization, error handling.

PURPOSE OF COURSE

To present fundamental concepts of languages and the formal mechanisms for describing and translating languages, to become familiar with compiler-writing tools, and to study all phases of compiling with primary emphasis on parsing and generating code for high-level programming languages.

EDUCATIONAL OBJECTIVES

Upon successful completion of the course, students should be able to:

1. Describe elements of formal language theory that are directly pertinent to lexical analysis and syntax analysis.
2. Describe top-down and bottom-up parsing methods fundamental to performing lexical analysis and syntax analysis on programs written in typical high-level programming languages.
3. Design a compiler to generate object code corresponding to a high-level programming language source program.
4. Describe the importance of the use of formal grammar techniques in the specification of a variety of process control applications.
